Application No.: 10/081,437 Docket No.: SONYJP 3.0-241

IN THE CLAIMS

1. (currently amended) A transmission device, comprising:

a receiving unit operable to receive a digital signal distributed from a prescribed distribution device;

a first generating unit operable to set identification corresponding to reception device information a reception control information for controlling the reception operation of the reception device in an area secured in format of composite information, thereby advance in a generating composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information;

a second generating unit operable to compose a predetermined number of digital signals <u>based</u> on the basis of the composite information to generate redistribution digital signals containing the composite information; and

a transmitter operable to transmit the redistribution digital signals to the reception device,

the redistribution digital signals are being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signals includes writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis,

Docket No.: SONYJP 3.0-241

Application No.: 10/081,437

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

- 2. (previously presented) The transmission device as claimed in claim 1, wherein the reception control information is set to control the reception operation for every digital signal for redistribution in the reception device.
- 3. (currently amended) The transmission device as claimed in claim 1, wherein the first generating unit generates the composite information every time a digital signal for redistribution is received by the reception device or so that the composite information is achieved by the reception device when the composite information is renewed.
- 4. (currently amended) The transmission device as claimed in claim 3, wherein the renewal of the composite information is recognized <u>based</u> on the basis of version information of the composite information.
 - 5. (currently amended) A transmission method, comprising: receiving a digital signal distributed from a prescribed distribution device;

setting identification information corresponding to a reception device and reception control information for controlling the reception operation of the reception device in an area secured in advance in a format of composite information, thereby generating composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information;

composing a predetermined number of digital signals based on the basis of the composite information to generate

Docket No.: SONYJP 3.0-241

Application No.: 10/081,437

redistribution digital signals containing the composite information; and

transmitting the redistribution digital signals to the reception device,

the redistribution digital signals are being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signals includes writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis,

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

6. (currently amended) A <u>computer-readable</u> recording medium having <u>recorded thereon</u> a computer-readable program <u>for carrying out a transmission methodrecorded thereon</u>, the <u>program method</u> comprising:

receiving a digital signal distributed from a prescribed distribution device;

setting identification information corresponding to a reception device and reception control information for controlling the reception operation of the reception device in an area secured in advance in a format of composite

information, thereby generating composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information;

composing a predetermined number of digital signals based on the basis of the composite information to generate redistribution digital signals containing the composite information; and

transmitting the redistribution digital signals to the reception device,

the redistribution digital signals are being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signals includes writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis.

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

7. (currently amended) A system—for performing—a transmission process, comprising:

a processor <u>for that executesing</u> instructions <u>for carrying out a method of performing a transmission process; and instructions, the <u>instructions</u> method including:</u>

receiving a digital signal distributed from a prescribed distribution device, $\boldsymbol{\tau}$

setting identification information corresponding to a reception device and reception control information for controlling the reception operation of the reception device in an area secured in advance in a format of composite information, thereby generating composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information, #

composing a predetermined number of digital signals <u>based</u> on the <u>basis</u> of the composite information to generate redistribution digital signals containing the composite information, + and

transmitting the redistribution digital signals to the reception device,

the redistribution digital signals are being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signals includes writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control

Docket No.: SONYJP 3.0-241

Application No.: 10/081,437

information for the reception device being performed on a frame-by-frame basis,

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

- 8. (currently amended) A reception device, comprising:
- a storage unit operable to store identification information corresponding to the reception device;
- a receiver operable to receive a redistribution digital signal containing composite information transmitted from a transmission device;
- an achieving unit operable to achieve reception control information corresponding to the identification information stored in the storage unit from an area secured in advance in a format of the composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information;
- an extracting unit operable to extract a desired digital signal from the redistribution digital signal by using the composite information; and
- a processor operable to process the desired digital signal $\underline{\text{based}}$ on $\underline{\text{the}}$ $\underline{\text{basis}}$ of $\underline{\text{the}}$ reception control information,

the redistribution digital signal is being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signal includes

writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis,

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

- 9. (currently amended) The reception device as claimed in claim 8, wherein the achieving unit achieves the reception control information every time that the redistribution digital signal is received by the receiver or when the composite information is renewed.
- 10. (currently amended) The reception device as claimed in claim 9, wherein the renewal of the composite information is recognized <u>from based on the version information</u> of the composite information.
- 11. (previously presented) The reception device as claimed in claim 8, wherein the achieving unit achieves the reception control information separately from the reception of the redistribution digital signal in the receiver.
 - 12. (currently amended) A reception method, comprising:
 storing identification information corresponding to a
 reception device;

receiving a redistribution digital signal containing composite information transmitted from a transmission device;

Application No.: 10/081,437

achieving reception control information corresponding to the stored identification information from an area secured in advance in a format of the composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information;

extracting a desired digital signal from the redistribution digital signal by using the composite information; and

processing the desired digital signal <u>based</u> on the basis of the reception control information,

the redistribution digital signal is being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signal includes writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis,

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

13. (currently amended) A <u>recording</u> <u>computer-readable</u> medium having recorded thereon a computer-readable program for

carrying out a reception methodrecorded thereon, the program method comprising:

storing identification information corresponding to a reception device;

receiving a redistribution digital signal containing composite information transmitted from a transmission device;

achieving reception control information corresponding to the stored identification information from an area secured in advance in a format of the composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information;

extracting a desired digital signal from the redistribution digital signal by—using the composite information; and

processing the desired digital signal <u>based</u> on the basis of the reception control information,

the redistribution digital signal is being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signal includes writing information identifying the reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis.

each frame transport packet being associated with a plurality of transport packets having the same format as

the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

14. (currently amended) A system—for performing a reception process, comprising:

a processor <u>for that executesing</u> instructions <u>for carrying out a method of performing a reception process; and instructions, the instructions method including:</u>

storing identification information corresponding to a reception device, $\boldsymbol{\tau}$

receiving a redistribution digital signal containing composite information transmitted from a transmission device, $\dot{\tau}$

achieving reception control information corresponding to the stored identification information from an area secured in advance in a format of the composite information, the composite information including (i) a version number of the composite information and (ii) a version number of the reception control information, +

extracting a desired digital signal from the redistribution digital signal $\frac{by}{a}$ using the composite information, $\frac{1}{a}$ and

processing the desired digital signal <u>based</u> on the basis of the reception control information,

the redistribution digital signal is being formed based on the basis of packets of the received digital signal and frame transport packets which are not part of the received digital signal, the frame transport packets including a predefined area in which data can be written, and the formation of the redistribution signal includes writing information identifying the

reception device in the predefined area and writing reception control information for the reception device in the predefined area,

the writing of information identifying the reception device and the writing of reception control information for the reception device being performed on a frame-by-frame basis,

each frame transport packet being associated with a plurality of transport packets having the same format as the packets of the received digital signal, and the reception control information written in the frame transport packet corresponding to the transport packets associated with the frame transport packet.

- 15. (new) The transmission device as claimed in claim 3, wherein the renewal of the composite information is recognized based on the version information of the reception control information.
- 16. (new) The reception device as claimed in claim 9, wherein the renewal of the composite information is recognized based on the version information of the reception control information.
